

**IN THE CLAIMS**

This listing of the claim will replace all prior versions and listings of claim in the present application.

**Listing of Claims**

Claim 1 (canceled).

2. (currently amended) ~~The~~ An information processing system ~~according to claim 1 comprising:~~

- at least one computer device;
- at least one storage device having a plurality of physical storage regions for storing data used by said computer device;
- physical storage region characteristics managing means for managing a level of storage characteristics provided by each of said plurality of physical storage regions;
- data storage destination managing means for managing associations between said plurality of physical storage regions and data stored in each physical storage region;
- characteristics change managing means for managing previously determined temporal change in the level of the storage characteristics required of said storage destination physical storage region by the data managed by said data storage destination managing means; and
- movement instructing means for acquiring, at prescribed times, the level of storage characteristics in a storage destination required by the data at that time, for each data item managed by said data storage destination managing means, further acquiring the level of storage characteristics of said physical storage region in which said data is actually stored, from said

BEST AVAILABLE COPY

physical storage region characteristics managing means, comparing said respective levels, and issuing an instruction to said storage device for said data to be moved to said physical storage region providing said required storage characteristics,

wherein said characteristics change managing means comprises:

a plurality of patterns of the temporal change in the level of said storage characteristics; and

wherein establishes the timing of said temporal change, is established  
in accordance with a pattern and a date and time specified by the user.

3. (currently amended) The information processing system  
according to claim 42,

wherein said storage characteristics are the performance, indicating the speed of processing, and the availability, indicating the speed of recovery.

4. (currently amended) The information processing system  
according to claim 42, further comprising:

physical storage region characteristics establishing means for  
establishing the a level of said storage characteristics in each of said physical  
storage regions; based on the basis of processing carried out with respect to  
each of said physical storage regions.

5. (original) The information processing system according to  
claim 4, wherein said storage region characteristics establishing means  
comprises:

replicate generating means for generating a replicate of the data stored in said physical storage region; and

caching means for placing the data stored in said physical storage region on a cache, as resident data.

6. (currently amended) The information processing system according to claim 5, wherein said reproduction generating means sets the replicated data to have high availability; and  
wherein said caching means sets the data placed on the cache to have high performance.

7. (currently amended) The information processing system according to claim 42, further comprising:  
data movement means for moving said data to said physical storage region having the required storage characteristics for storing said data; in accordance with instructions from said movement instructing means.

8. (currently amended) The information processing system according to claim 7, wherein the data storage destination managing means manages the logical storage regions accessed directly by said computer device which issues requests relating to said data; and information associating said logical storage regions and the physical storage regions in which said data is stored; and  
wherein ~~and~~ said movement instructing means acquires the level of said storage characteristics, for each data item, and for each of said logical

BEST AVAILABLE COPY

storage regions, and if said levels do not match, then it issues a movement instruction for said logical storage region unit.

9. (currently amended) The information processing system according to claim 7, further comprising:

data storage destination updating means for updating the information managed by said data storage destination managing means; in such a manner that said data is associated with said physical storage region after movement.

Claims 10 and 11 (canceled).

12. (currently amended) ~~The computer device according to claim 11~~ A management computer device, comprising:  
an interface connected via a network to a computer device and a storage device having a plurality of physical storage regions storing data used by said computer device; and  
a control unit section and a memory connected to said control section, wherein said memory holds levels of storage characteristics provided by each of said plurality of physical storage regions, and previously established temporal change in a level of the storage characteristics required of said physical storage regions forming storage destinations, by the data to be stored in said physical storage regions,  
wherein said control section compares the level of the storage characteristics of a storage destination required by the data at a particular

BEST AVAILABLE COPY

time at prescribed times, for each data item, with the level of the storage characteristics of said physical storage region in which said data is actually stored, and if said levels are not matching, then it sends an instruction for said data to be moved to said physical storage region providing said required storage characteristics to the storage device having said physical storage region in which said data is actually stored, via said interface,

wherein a plurality of patterns of the temporal change in the level of storage characteristics required of said storage regions are held in said memory; and

~~and wherein~~ said control section establishes the timing of said temporal change, based on the basis of the selection of a prescribed pattern and specification of a date and time, and acquires the storage characteristics of the storage destination required by said data at that particular time, from said memory, in accordance the pattern thus established.

13. (currently amended) The management computer device according to claim ~~11~~12, wherein a plurality of patterns of the temporal change of the level of storage characteristics required of said storage regions are held in said memory; for each attribute of the data used by said computer device; and wherein said control section acquires the level of storage characteristics of the storage destination required by said data at that time; from said memory.

Claim 14 (canceled).

15. (currently amended) An information processing system according to claim 2, wherein said storage device further includes ~~A storage device in an information processing system comprising a computational device, and a storage device having a plurality of physical storage regions for storing data used by said computational device; further comprising: the logical storage regions accessible to accessed directly by said~~ at least one host computer device;

logical/physical mapping information storing means for storing logical/physical mapping information creating associations between said logical storage regions and said physical storage regions;

data movement means for moving the data in said physical storage region associated with a prescribed one of said logical storage regions, to another of said physical storage regions, in accordance with said instruction issued by said movement instructing means ~~an external instruction;~~ and

association changing means for changing said logical/physical mapping information, in such a manner that said prescribed logical storage region is associated with the physical storage region after movement.

16. (currently amended) An information processing system ~~The storage device according to claim 15, wherein said host computer device is connected to other storage devices which it cannot access directly, and access to the data stored in the physical storage regions of said other storage devices is provided in the form of logical storage regions accessed directly by said computer device; accesses, via said logical storage regions, to the data stored in the physical storage regions of other storage devices, and~~

wherein said logical/physical mapping information storing means  
~~comprising~~ comprises:

logical/physical mapping information creating associations between  
said logical storage regions and the physical storage regions in said other  
storage devices.

Claims 17 and 18 (canceled).

19. (original) The computer-readable storage medium according  
to claim 16, further causing a computer to perform the functions of:

data replicating means for instructing replication of data stored in a  
particular physical storage region of the plurality of physical storage regions of  
a storage device managed by a management device controlled by said  
computer;

caching means for instructing that data stored in a particular physical  
storage region of the plurality of physical storage regions of a storage device  
managed by a management device controlled by said computer is to be  
placed on the cache as resident data; and

storage characteristics level establishing means for establishing the  
respective storage characteristics levels of said plurality of physical storage  
regions, in accordance with processing carried out by said data replicating  
means and said data caching means.

20. (currently amended) A computer system, comprising:  
a computer device connected to a network;

a management computer device having a first interface connected to the network and a first memory and first control section;

a first storage device comprising a second interface connected to said computer device via the network, a third interface connected to another external storage device, physical storage regions for storing data used by said computer device, a second control section and a second memory; and

a second storage device comprising a fourth interface connected to said first storage device by means of the network, a third control section, physical storage regions storing data used by said computer device, and a third memory;

wherein said management computer device holds, in said first memory, the levels of storage characteristics, including the a performance indicating the a processing speed and the availability indicating the a recovery speed, provided by each of said plurality of physical storage regions, and previously established temporal change in the a level of storage characteristics required of said physical storage region forming a storage destination, by the data stored in said physical region;

wherein said first control section comprises a plurality of patterns of temporal change in the level of said storage characteristics, establishes the timing of said temporal change in accordance with a pattern and date and time specified by a user, and compares the level of the storage characteristics of a storage destination required by the data at a particular time, for each data item, at prescribed times, based on the basis of the timing thus established, with the level of the storage characteristics of said physical storage region in which said data is actually stored, and if said levels are not matching, then it

BEST AVAILABLE COPY

sends an instruction for said data to be moved to said physical storage region providing said required storage characteristics, to the storage device having said physical storage region in which said data is actually stored, via said interface;

wherein said first storage device holds, in said second memory, logical/physical mapping information for said first logical storage regions provided in order that said computer device can request data, and the physical storage regions actually located in said first storage device, in which said data is stored; and associations between said first logical storage regions, the logical storage regions provided externally by said second storage device, and the physical storage regions in which said data is stored;

wherein said control section receives said movement instructions via said second interface, and if said data movement is a movement between said first storage device and said second storage device, then it section-refers to said associations, and specifies the logical volume of said second storage device relating to said movement, by means of said third interface, as well as instructing movement of the data to said second storage device; and moves the data stored in said physical storage region to a designated physical storage region, in accordance with said instruction, and updates said logical / physical mapping information and said associations, in accordance with said movement;

wherein said second storage device holds, in said third memory, associations between said logical storage regions provided externally and the physical storage regions in which said data is stored; and

BEST AVAILABLE COPY

wherein said third control section receives a data movement instruction from said first storage device, via said fourth interface, and performs movement of said data.
